

## Fork Positioner for Forklifts

Forklift Fork Positioner - The fork positioner is actually a hydraulic device that could allow the driver to work the forklift without leaving the seat. They are made out of high quality materials and are intended to withstand the most challenging procedures and work surroundings. Side shifting models have the extra ability to laterally position the entire load or the arms in order to facilitate much more exact lifting and placement in a faster and much more efficient method.

The unique blade pocket design can enable operators to securely sway the unit's forks without any worry of destroying the positioning cylinders. This could allow the operator the alternative to either execute simultaneous or independent blade movement, depending on the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are required. Standard OEM carriages can be transformed into fork positioners on existing units.
